

Consumer Survey

2013, March

Consumer confidence unchanged - consumption not attractive

The consumer confidence indicator stood at 10.2 in March, having been 9.6 in February and 4.5 in January. In March, confidence in the economy was slightly higher than one year ago (8.0) but below the long-term average (12.5). The data are based on Statistics Finland's Consumer Survey, for which 1,438 people resident in Finland were interviewed between 1 and 18 March.

Consumer confidence indicator (CCI)

* average 10/1995 - 03/2013

Consumers' views regarding all four components of the consumer confidence indicator remained more or less unchanged from the previous month in March. Expectations concerning the development of unemployment were still gloomy and views concerning consumers' own and Finland's economy were cautious. By contrast, views on own saving possibilities were good.

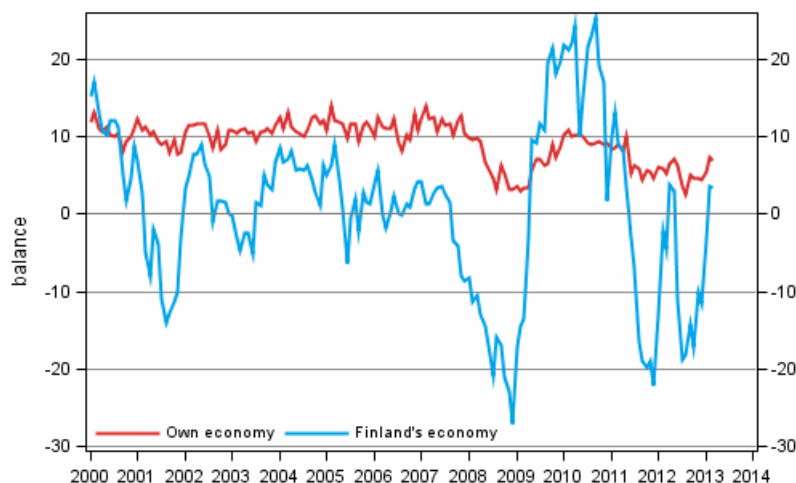

In addition, consumers thought in March that the time was more favourable for raising a loan than for saving and especially for buying durable goods. In March, employed consumers felt personally somewhat more threatened by unemployment than before.

Consumers' own and Finland's economy

In March, 33 per cent of consumers believed that Finland's economic situation would improve in the coming twelve months, while 24 per cent of them thought that the country's economy would deteriorate. In last year's March, the corresponding proportions were 27 and 32 per cent.

In all, 25 per cent of consumers believed in March that their own economy would improve and 14 per cent of them feared it would worsen over the year.

Consumers' expectations concerning their own and Finland's economy in 12 months' time

Unemployment and inflation

Seventeen per cent of consumers expected in March that general unemployment would decrease in Finland over the next 12 months, while 48 per cent of them believed it would increase.

In March, 10 per cent of employed persons believed that their personal threat of unemployment had lessened over the past few months, whereas 22 per cent thought it had grown. The corresponding proportions were 11 and 18 per cent in February and 13 and 19 per cent one year ago. In March, nearly half (45%) of employed persons thought the threat of unemployment had remained unchanged and one-fifth (22%) felt that they were not threatened by unemployment at all.

Consumers predicted in March that consumer prices would go up by 3.0 per cent over the next 12 months. The long-term predicted average inflation rate is 2.2 per cent.

Buying of durable goods

Thirty-five per cent of consumers considered the time favourable for buying durable goods in March. Roughly as many, or 36 per cent, considered the time unfavourable for consumption. The respective proportions were 37 and 32 per cent in February and 40 and 31 per cent one year ago.

In March, various consumption intentions were moderate. Only 14 per cent of households were fairly or very certain to buy a car and six per cent a dwelling in the next twelve months. In March, 20 per cent of households were planning to make renovations to their dwelling.

Saving and taking out a loan

Altogether 54 per cent of consumers considered saving worthwhile in March. Twelve months ago the respective proportion was 61 per cent of consumers. Two out of three households (63%) had been able to lay aside some money in March and four out of five (80%) believed they would be able to do so during the next 12 months.

In March, 57 per cent of consumers regarded the time good for raising a loan. Twelve per cent of households were planning to raise a loan within one year. One year earlier, 14 per cent of them thought so.

Consumers' views of the economy

	Average 10/1995-	Max. 10/1995-	Min. 10/1995-	03/2012	02/2013	03/2013	Outlook
A1 Consumer confidence indicator, CCI = (B2+B4+B7+D2)/4	12,5	22,9	-6,5	8,0	9,6	10,2	-
B2 Own economy in 12 months' time (balance)	8,7	14,1	2,3	5,3	7,4	7,0	-
B4 Finland's economy in 12 months' time (balance)	3,8	25,3	-27,1	-4,4	3,5	3,5	+/-
B6 Inflation in 12 months' time (per cent)	2,2	4,6	0,6	3,1	3,1	3,0	
B7 Unemployment in Finland in 12 months' time (balance)	-0,9	27,6	-51,1	-16,5	-20,3	-17,8	-
B8 Own threat of unemployment now (balance)	0,4	7,6	-18,8	-2,8	-3,1	-7,2	--
C1 Favourability of time for purchasing durables (balance)	19,6	41,8	-14,2	9,0	5,0	-1,3	--
C2 Favourability of time for saving (balance)	11,6	36,8	-19,6	14,3	8,9	5,7	-
C3 Favourability of time for raising a loan (balance)	17,4	42,0	-47,1	11,4	13,6	12,0	-
D2 Household's saving possibilities in the next 12 months (balance)	38,4	52,2	10,9	47,7	47,6	48,3	+

The **balance figures** are obtained by deducting the weighted proportion of negative answers from that of positive answers. The **consumer confidence indicator** is the average of the balance figures for the CCI components. The balance figures and the confidence indicator can range between -100 and +100 – the higher (positive) balance figure, the brighter the view on the economy.

Explanations for **Outlook** column: ++ Outlook is very good, + Outlook is good, +/- Outlook is neutral, - Outlook is poor, -- Outlook is very poor. Deviation of balance from average has been compared to standard deviation.

The population and sample of the Survey

The population of the Consumer Survey comprises 4.4 million persons aged 15 to 84 and their 2.6 million households in Finland. The population was extended to persons aged 75 to 84 starting from January 2012. The gross size of the monthly sample of the Survey is 2,350 persons (previously 2,200 persons).

In March, the non-response rate of the Survey was 38.8 per cent. The non-response rate includes those who refused from the survey or were otherwise prevented from participating, as well as those who could not be contacted.

The extension of the population, that is, responses from persons aged 75 to 84, is estimated to have weakened the value of the consumer confidence indicator by good one unit starting from January 2012. This has primarily been caused by a drop in the balance figure of one component, namely own household's

saving possibilities. The extension of the population has also somewhat affected the results on owning various home technology.

EU results

The (seasonally adjusted) Consumer Survey results for all EU countries are released on the European Commission website: European Commission, DG ECFIN, Business and Consumer Survey Results; http://ec.europa.eu/economy_finance/db_indicators/surveys/index_en.htm

1. Method of the Consumer Survey

The Consumer Survey is a telephone interview survey by means of which it is possible to measure Finns' images - assessments and expectations - of the general economic development and the financial situation of one's own household and intentions to make major purchases, save money or take out a loan. In addition, the survey is a tool for finding out how common modern machines and equipment are in households.

The first Finnish Consumer Survey was conducted in November 1987. Until 1991 it was carried out twice a year, in May and November. In 1992 the survey times were rose to four: the survey months were February, May, August and November. Since October 1995 the Consumer Survey data have been collected monthly on assignment of the European Commission.

The Consumer Survey has a totally new individual sample each month. The same sample is also used for the data collection of the Finnish Travel Survey and some other surveys as well. The sample size of the Consumer Survey is 2,350 persons monthly. The non-response rate nowadays being about 35 per cent, approximately 1,500 responses are gained every month. The non-response rate includes those who refused from the survey or were otherwise prevented from participating as well as those who could not be contacted.

The interviews are conducted from Statistics Finland's CATI Centre during the first two or three weeks of the month. The target area is the whole country and the respondents of the Consumer Survey represent the 15 to 84-year-old population in Finland, according to age, gender, province of domicile and native language.

All the response data of the Consumer Survey are weighted against the total population by means of sample weights. Weighting corrects the effects of non-response and improves the statistical accuracy of the data. The weights are established by using a calibration method and the probability of each observation to be included in the sample. The figures and series presented are not seasonally adjusted.
