

Consumer Confidence

2019, June

Consumer confidence sank in June

In June, the consumer confidence indicator (CCI) stood at -4.6, while in May it was -1.8 and in April -1.7. Last year in June, the CCI received the value 1.7. The average for the CCI since January 2018 is 0.5. The data are based on Statistics Finland's Consumer Confidence Survey, to which 1,019 persons resident in Finland responded between 1 and 17 June. The survey methods were [revised](#) in May.

Consumer confidence indicator (CCI)

Of the four components of the CCI, only intentions to spend money on durable goods remained unchanged in June from May. The other components weakened clearly. Expectations concerning Finland's economy in general were very pessimistic. Views on consumers' own economic situation now and in the future were also weak. Consumers' intentions to spend money on durable goods were higher than average in June.

In June, the CCI components weakened compared with the corresponding period last year as well, apart from intentions to spend money. Especially expectations concerning Finland's economy plummeted over the year.

Consumers' expectations concerning their own and Finland's economy in 12 months' time

In June, consumers considered their own financial situation weaker than previously. The time was, in general, regarded favourable for raising a loan, but not so much for saving or buying durable goods. In June, employed consumers felt that their personal threat of unemployment has increased in recent times. On the other hand, every second employed person did not experience any threat.

Consumer confidence by major region and population group

In June, consumers' confidence in the economy was strongest in Greater Helsinki (CCI -0.1) and weakest in Eastern Finland (-10.3). Among population groups, upper-level salaried employees were most optimistic (1.3). Pensioners clearly had the gloomiest expectations concerning economic development (-13.8). More information can be found in [Database tables](#).

EU results

The (seasonally adjusted) Consumer Survey results for all EU countries are released monthly on the European Commission website: [Press releases](#).

Concepts

The **balance figures** are obtained by deducting the weighted proportion of negative answers from that of positive answers. The **consumer confidence indicator** (CCI/A1) is the average of the balance figures for the CCI components. The components of the CCI are: consumer's own economy now (B1), consumer's own economy in 12 months (B2), Finland's economy in 12 months (B4) and consumer's spending money on major purchases in the next 12 months compared to the past 12 months (E1). The balance figures and the confidence indicator can range between -100 and +100 – the higher (positive) balance figure, the brighter the view on the economy.

Review

Consumers' own and Finland's economy

In June, 14 per cent of consumers believed that Finland's economic situation would improve in the coming twelve months, while 39 per cent of them thought that the country's economy would deteriorate. The respective proportions in May were 14 and 31 per cent.

In all, 26 per cent of consumers believed in June that their own economy would improve and 15 per cent of them feared it would worsen over the year. The respective proportions in May were 29 and 13 per cent. Twenty-six per cent of consumers estimated that their economy was now better than a year ago and 19 per cent felt that it was worse in June. In May, the respective proportions were 30 and 17 per cent.

Unemployment and inflation

Altogether, 26 per cent of consumers thought in June that unemployment would decrease over the year, while 28 per cent of them believed it would increase. The respective proportions in May were 24 and 30 per cent.

In June, as many as 52 per cent of employed persons felt that they were not threatened by unemployment at all. Seven per cent of employed persons reckoned that their personal threat of unemployment had lessened over the past few months, while 12 per cent thought it had grown.

Consumers estimated in June that consumer prices would go up by 2.9 per cent over the next 12 months. In May, the predicted inflation rate was 2.4 per cent, and its long-term average since January 2018 is 2.6 per cent.

Saving and taking out a loan

In June, 64 per cent of consumers thought the time was favourable for saving. In June, 58 per cent of consumers had been able to lay aside some money and 76 per cent believed they would be able to do so during the next 12 months.

In June, 64 per cent of consumers regarded the time good for taking out a loan. Nineteen per cent of consumers considered raising a loan within one year.

Buying of durable goods

In June, 29 per cent of consumers considered the time favourable for buying durable goods. Thirteen per cent of consumers planned on increasing and 33 per cent on reducing their spending on durable goods over the next 12 months.

In June, 15 per cent of consumers were either definitely or possibly going to buy a car during the next 12 months. Thirteen per cent of consumers considered buying a dwelling. Twenty-one per cent of consumers were planning to spend money on renovating their dwelling within a year.

Method of the Consumer Confidence Survey

The Consumer Confidence Survey measures Finnish consumers' confidence in the economy, that is, views and expectations about the development of their own and Finland's general economic situation. The survey also examines consumers' intentions of making major purchases, saving and raising loans. The survey is carried out with a mixed-mode data collection method, i.e. with a web questionnaire and by telephone interviews (CATI). For the Consumer Confidence Survey, answers are given by means of answer options (qualitative survey).

The former name of the Consumer Confidence Survey was the Consumer Survey. Earlier the survey was carried out by means of telephone interviews only. The first interviews were conducted in November 1987. Until 1991, the survey was carried out twice a year, in May and November. In 1992, the survey times increased to four: the survey months were February, May, August and November. Since October 1995, the consumer confidence data have been collected monthly on assignment from and partial financing of the [European Commission](#).

Sampling and data collection

The population of the Consumer Confidence Survey comprises 3.9 million persons aged 18 to 74 in Finland. The panel design is used in the survey: everybody answers twice within six months. Each month, the target is a random sample of 2,200 persons, of whom one half are included in the first round and one half in the second round. The target area of the survey is the whole country and the respondents represent the population in Finland, according to age, gender, area of residence and native language. The data collection period for the survey is the first two or three weeks of the month.

In June 2019, in all, 1,019 responses were gained, so the non-response rate of the survey was 53.7 per cent. The non-response rate includes those who refused from the survey or were otherwise prevented from participating, as well as those who could not be contacted. Possible over-coverage (dead, moved abroad, etc.) is also included in non-response here.

Weighting

The response data of the Consumer Confidence Survey are expanded to the whole population with weighting coefficients. Weighting corrects the effects of non-response and improves the statistical accuracy of the data. The weights are established by using a calibration method (Calmar) and the probability of each observation to be included in the sample. The figures and series presented are not seasonally adjusted.
